Profile of Indiana's Population and Housing

John R. Gordon*

Summary

From 1960 to 1970 Indiana's population increased from 4,662,498 to 5,193,669, an increase of 531,171 people or 11.4 percent. This percentage increase was less than the United States average but virtually the same as the other North Central states.

County growth rates varied considerably. Porter and Monroe counties experienced population increases of more than 40 percent between the two census periods. Only Switzerland County declined by more than 10 percent.

Marion County, which includes Indianapolis, has the largest population of Indiana counties. In 1970 its population was 792,299 or 15.3 percent of the state total. The population density was also high with 2,021 people per square mile.

Despite the fact that 64.9 percent of Indiana's population is classified as urban, over 70 percent of the counties are predominantly rural. Seventy-three of the 92 counties have population densities less than the state average of 143.9.

Indiana's population increased by 547,049 during the 1960's as the result of natural increases (more births than deaths). The recorded population increase for the decade was 531,171 because net out-migration accounted for 15,878 people.

With the exception of Vermillion, all counties reported a larger number of births than deaths between 1960 and 1970. However, 59 of Indiana's 92 counties experienced net out-migration.

Over one-half of Indiana's 1970 population was female and almost 93 percent was

White. The median age was 27.2 years, down from 28.9 years in 1960.

Total number of housing units increased more rapidly than the population. In 1970 there were 1.7 million housing units in Indiana which represented a 15.1 percent increase over the 1.5 million units present in 1960. The year-round housing in 1970 was 78.4 percent one-unit structures, 18.1 percent two- or more unit structures, and 3.5 percent mobile homes or trailers. The median value of an owner occupied housing unit was \$13,800 and the median contract rent was \$82 per month.

Introduction

This report is designed to present a statistical picture of Indiana's population and housing by county and region in 1970. It is based entirely upon data from the 1960 and 1970 Census of Population and Housing which were collected on a 100 percent sample basis. The discussion is intended to highlight the current situation and indicate some of the changes which have occurred relative to Indiana's population and housing between the 1960 and 1970 census. Analysis of the data is limited to the identification of changes which have come about during the 10-year period.

The reader who desires information on a specific county or region can refer to the tables. Tabular data list the counties alphabetically and, in addition, data are included for the 14 Indiana Planning and Development Regions (Figure 1). The tables in this report were prepared on a computer from

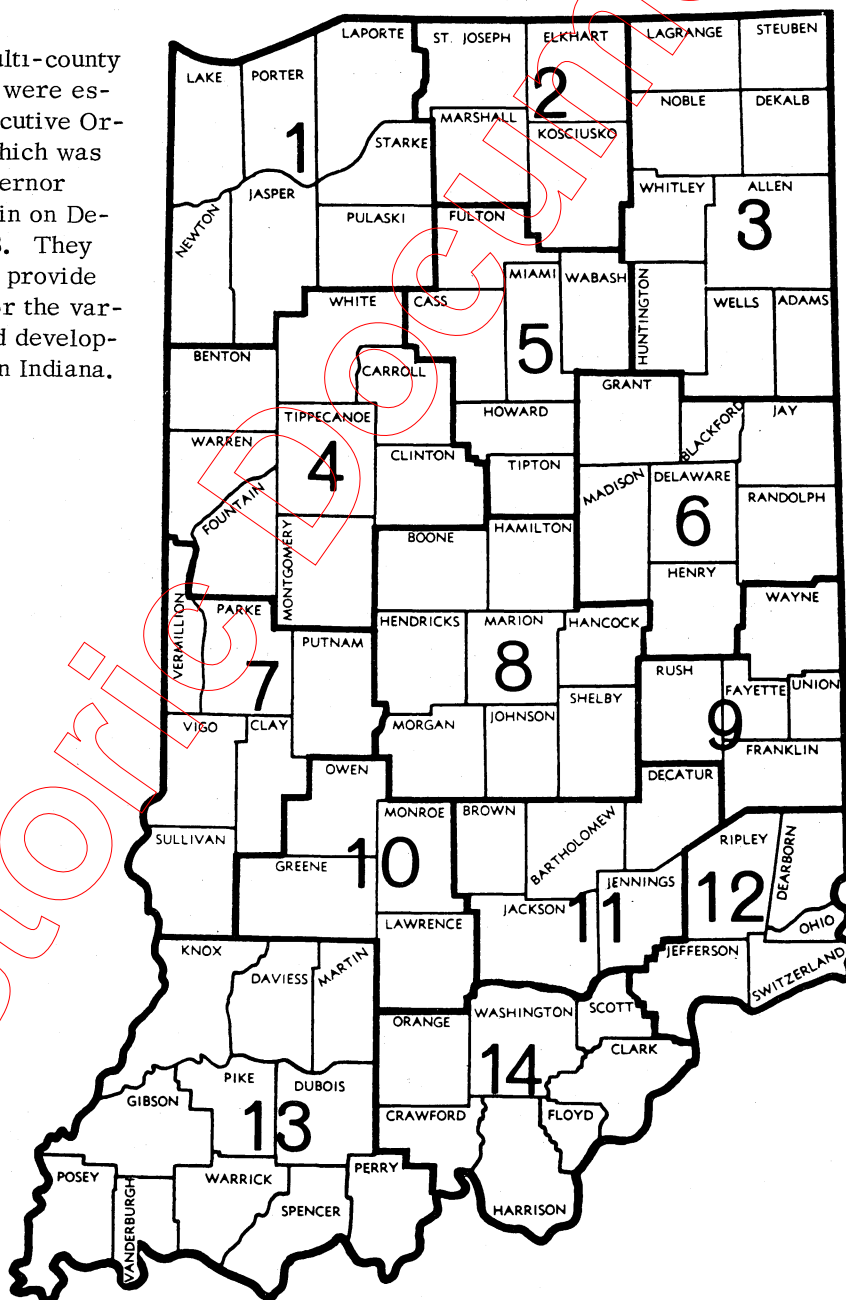

*Technical assistance was provided by Helen Blake and Jesús Chollett.

county data. State and region figures were calculated from the county data. Because of rounding errors, the state totals may not be precisely the same figures that are reported in the printed census reports. However, inspection of the data indicates that the differences that do exist are quite small.

Township information is not included in this report because of space limitation. Population numbers and general characteristics of the population are reported by townships in Bureau of Census publications for Indiana entitled "Number of Inhabitants" and "General Population Characteristics."

Figure 1
Indiana Planning and Development Regions*

*Fourteen multi-county areas in Indiana were established by Executive Order No. 16-68 which was approved by Governor Roger D. Branigin on December 14, 1968. They were intended to provide uniform areas for the various planning and development activities in Indiana.

Population Numbers

Number of Inhabitants

The United States population at the time of the 1970 census was 203,194,772. This represents an increase since the last census of about 24 million people or 13.3 percent. The numerical increase was the second largest in the history of the United States, but the percentage increase was second lowest. A lesser percentage increase occurred from 1930 to 1940.

About one-half of the nation's increase in population was in seven states (Figure 2): California (4.2 million), Florida (1.8 million), Texas (1.6 million), New York (1.4 million), New Jersey, (1.1 million), Michigan (1.1 million), and Illinois (1.0 million). Three states--West Virginia, North Dakota and South Dakota--and the District of Columbia lost population.

The fastest growing state was Nevada with a 71.3 percent increase in population (Figure 3). Other rapidly growing states include Florida (37.1 percent), Arizona (36.1 percent), Alaska (33.6 percent), California (27.0 percent), Maryland (26.5 percent), and Colorado (25.8 percent).

Indiana's population increased from 4,662,498 in 1960 to 5,193,669 in 1970 (Table 1). This represents an increase of 531,171 people or 11.4 percent (Table 2). This is slightly below the 13.3 percent increase in the United States but virtually the same as the 11.1 percent increase in the North Central states which include Indiana, Illinois, Wisconsin, Michigan, and Ohio. Among the 50 states, Indiana ranked 11th in terms of population in 1970.

Each of the 14 planning and development regions in Indiana increased in population from 1950 to 1960 and from 1960 to 1970 (Tables 1 and 2). Regions 3, 8, 10, 11, and 14 grew more rapidly in population from 1960 to 1970 than the state increase of 11.4

percent. The largest increase was 21.3 percent in Region 10. However, Region 8 is the only area which increased its share of Indiana's population on a percentage basis over both census periods. The percentage of people in Region 8 grew from 18.5 in 1950 to 20.3 in 1960 and had reached 21.4 percent in 1970.

In the United States about one-half of the counties lost population over the 1960 to 1970 period. Of Indiana's 92 counties only 16 declined in population during this time (Figures 4, 5 and 6 and Tables 1 and 2). Just one county, Switzerland, had a population decline above 10 percent. Of the counties in Indiana which lost population only eight declined in population during the 1950 to 1960 census period.

The remaining 76 counties experienced some increase. Twenty-two counties had population growth rates exceeding the national average of 13.3 percent. Thirty counties grew faster than the state average of 11.4 percent (Figure 6).

Porter and Monroe counties had growth rates of 44.5 and 43.3 percent, respectively (Figure 5). Porter County increased from 60,279 in 1960 to 87,114 in 1970. The Bureau of the Census suggests that much of this growth came as in-migration from former Lake County residents. Monroe County's population increased during the census period from 59,225 to 84,849. Much of this growth was associated with Indiana University at Bloomington.

Five additional counties experienced growth rates of more than 30 percent--Johnson, Hamilton, Hendricks, Hancock, and Morgan. All five of these counties border Marion County which includes Indianapolis. These five plus Porter and Monroe accounted for 22 percent of the population growth in Indiana during the 1960's.

Marion County is Indiana's largest county based on population. Its 1970 population was set at 792,299 or 15.3 percent of the state's population (Figures 4 and 7). Lake County has 10.5 percent, Allen County 5.4 percent, and Vanderburgh County 3.2 percent of the state's population. At the other end of the scale thirty-five counties contain less than 0.5 percent of Indiana's population. Union, Ohio and Switzerland counties each have only 0.1 percent of the state's population.

Population Density

The average number of people per square mile of land area is referred to as the population density. In 1970 the population density in Indiana was 143.9, up from 128.9 in 1960 (Figure 8 and Table 3). On the average, each square mile in Indiana is occupied by 15 more people in 1970 than in 1960. Nineteen counties have population densities above the state average. Marion County is the most densely populated county in Indiana with 2,021 people per square mile. At the other extreme, Warren County has a population density of only 24. A total of 26 counties, concentrated in the western and southern parts of the state, had a population density under 50.

Urban and Rural Populations

The urban population comprises all persons living in urbanized areas and in places of 2,500 inhabitants or more outside urbanized areas. The rural population includes

all people living in places with less than 2,500 inhabitants. In 1970, 3,372,060 people in Indiana were living in urban areas (Table 4). This represents 64.9 percent of the state's population versus 62.4 percent in 1960. In the United States about 73.5 percent of the population is urban. The remaining 1,821,609 people or 35.1 percent of Indiana's population lives in rural areas (Table 5).

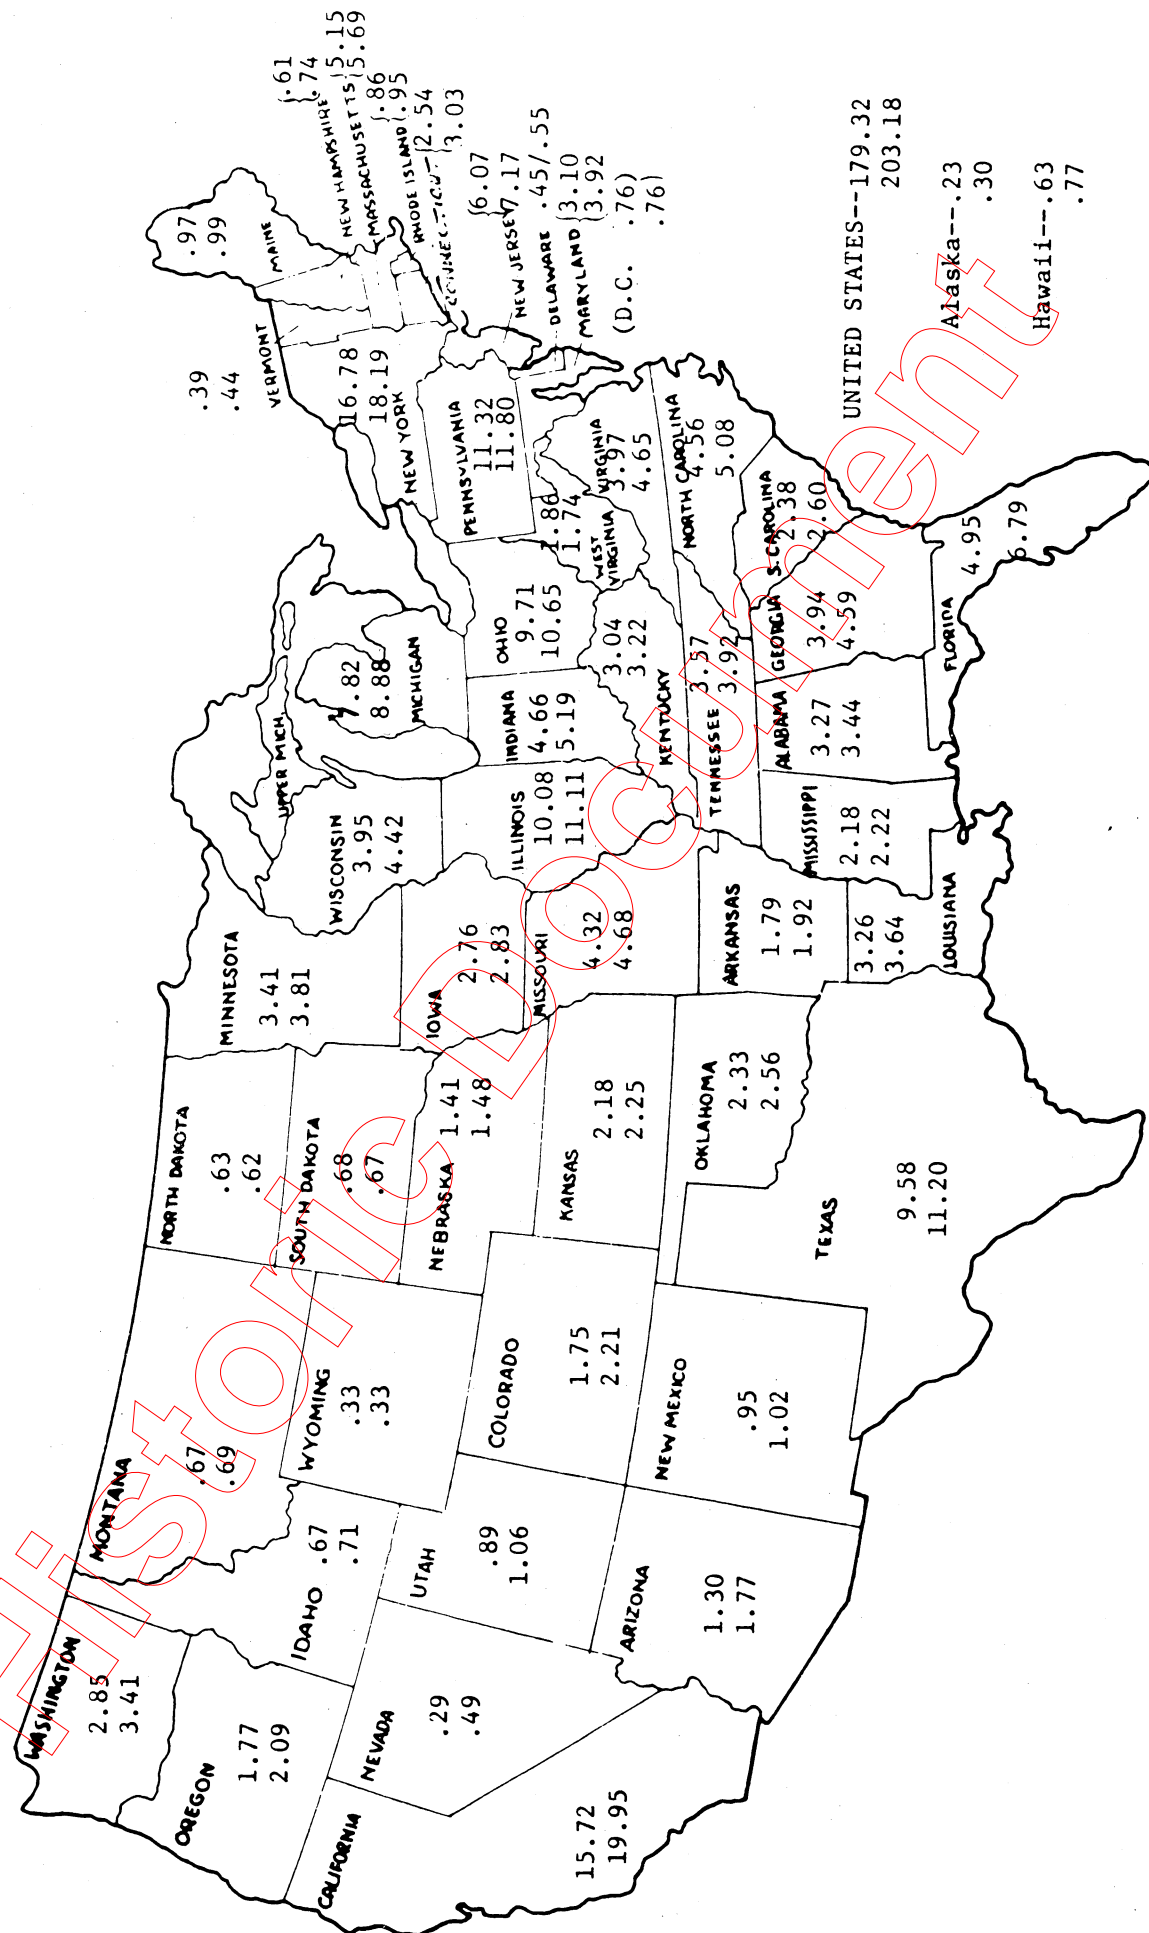

From 1960 to 1970 the urban population increased by 461,911 (15.9 percent) while the rural population increased by 69,260 (4.0 percent). Consequently the number of urban people per 100 rural residents has been increasing. This figure divided by 100 is the urban/rural ratio (Table 6). In 1960 there were 166 urban residents and by 1970 this number had increased to 185.

Thirteen counties have a larger urban/rural ratio than the state average and the remaining 79 counties are more rural than the state average (Figure 9). Sixty-six counties have larger rural than urban populations and ten of these rural counties have no urban population at all (Figure 10). The urban/rural ratio is particularly high in Marion County, 538.3 urban residents to each rural resident, partly because Indianapolis city boundaries were redefined to encompass most of Marion County. In 1970 that county was classified 99.8 percent urban.

Among the regions, only Regions 1, 2 and 8 have a higher proportion of urban residents than the state average. Regions 7 and 9 experienced absolute declines in number of urban residents between 1960 and 1970.

Components of Population Change

A county's population increases through live births to its residents and through migration into it from other places. A population decreases through death of its residents and through migration from it to other places. All four of these components of population change are constantly occurring within a population. The balance between births and deaths is referred to as "natural" changes. The balance between the in- and out-migration flow is called "net" migration.

Marion County recorded the largest number of births from 1960 to 1970--167,127 (Figure 11 and Table 7). Other counties with more than 30,000 births include Lake (118,357), Allen (56,796), St. Joseph (45,690), and Vanderburgh (31,342). Collectively, these five counties accounted for 41.0 percent of the births in Indiana and, of course, the same counties recorded the largest number of deaths. Together they had 174,298 or 36.6 percent of the deaths in Indiana.

Subtracting the number of deaths from the number of births gives the natural increase for that county (Figure 12 and Table 7). All counties showed a natural increase from 1960 to 1970 with the exception of Vermillion County which experienced 116 more deaths than births. Marion, Lake, Allen and St. Joseph led in natural increases.

The remaining component of population change, net migration, is calculated by subtracting natural increase from the difference of population between 1970 and 1960 (Figure 13 and Table 7). A positive net migration figure is an indication of migration into the county while a negative net migra-

tion figure indicates migration out of the county.

Indiana's population increased by 547,049 between 1960 and 1970 because of an excess of births over deaths (natural increase). The actual population growth for this decade was 531,171 because net out-migration accounted for 15,878 people.

Between 1960 and 1970, 59 of Indiana's 92 counties experienced net out-migration. Three counties lost more than 10,000 people through net out-migration--Lake, St. Joseph, and Vanderburgh. On the other hand 33 counties had net in-migration. Four counties--Porter, Monroe, Allen, and Johnson--each gained more than 10,000 people through net in-migration.

Net migration data are transformed into migration rate data by dividing net migration figures by the population at the beginning of the period (in this case, 1960) and multiplying by 100 to show migration rate percentages (Figure 14 and Table 7). Five counties in Indiana had negative migration rates in excess of 10 percent--Switzerland (-14.0 percent), Benton (-13.2 percent), Miami (-12.0 percent), Martin (-11.6 percent), and Fountain (-10.3 percent). Each of these is predominantly a rural county.

On the other hand eight counties had positive migration rates in excess of 10 percent--Porter (28.2 percent), Monroe (25.4 percent), Johnson (24.3 percent), Hamilton (24.2 percent), Brown (21.2 percent), Hancock (17.3 percent), and Hendricks (16.7 percent). Many of these counties are close to Indianapolis although Marion County itself experienced a small percentage of out-migration.

Population Characteristics

Sex

More than 51 percent of Indiana's 1970 population was female (Table 8). The official count for Indiana showed 2,662,499 females and 2,531,170 males.

The average number of males per 100 females is referred to as the sex ratio (Figure 15). For the state of Indiana this ratio was 95 at the time of the 1970 census. This is essentially the same as the United States average.

Only 8 of Indiana's 92 counties had more males than females (sex ratio exceeded 100). The largest number of males per 100 females was 108.9 in Steuben County. The lowest ratio was 89.6 in Vanderburgh County.

Race

In the census, people are asked to indicate their race by selecting one of a number of race categories. Three categories are reported for this discussion--White, Negro, and other races (Figure 16 and Table 9). The "other races" category includes American Indian, Chinese, Filipino, and all others.

The 1970 census reported a count of 4,820,324 Whites; 357,464 Negroes; and 15,881 other races in Indiana. On a percentage basis this was 92.8 percent White, 6.9 percent Negro, and 0.3 percent other races. The 1960 census showed 94.1 percent White, 5.8 percent Negro, and 0.1 percent other races. During the decade of the 1960's the other races increased 240 percent, the Negro population increased 36 percent, and the White population increased 10 percent.

Sixty-nine percent of the Negro population in Indiana is located in two counties--Lake and Marion. Only four counties have a percentage of Negro population greater than or equal to the state average--Lake (20.5 percent), Marion (17.0 percent), St. Joseph

(7.6 percent), and Allen (6.9 percent). Three counties--Warren, Blackford, and Crawford--reported no Negroes.

By contrast the population of the other-races category is fairly evenly spread across the state. Every county has population in this category. Twenty-two counties had percentages of other races exceeding the state average. Two counties had percentages of other races in excess of one percent--Monroe and Tippecanoe. Each contains a large university.

Age

Since 1950 the median age of Indiana's population has been slowly declining. In 1950 the median age was 30.4 years. By 1960 it had declined to 28.9 years and in 1970 the median age of Indiana's population was 27.2 years. Indiana's population by age categories is shown for each county in Table 10.

Interestingly, the number and percentage of children under 5 years of age was smaller in 1970 than in 1960 (Figure 17). Indiana had 455,676 children representing 8.8 percent of its total population under 5 years of age in 1970 compared with 542,950 or 11.6 percent in 1960. A decline in this age category has not occurred since the decade of the 1930's.

Only 6 of Indiana's 92 counties had a larger number of children under 5 years of age in 1970 than in 1960. These counties included Porter, Lagrange, Hancock, Brown, Monroe, and Pike.

This sharp decline in numbers of children does not appear in the age group 5-9 years. The number of children ages 5-9 years in Indiana in 1970 was 529,024 compared to 499,393 in 1960. However, as a percentage of the total population the 1970 figure was smaller than the 1960 figure, 10.2 versus 10.7 percent.

542.9

Housing Characteristics

Number of Housing Units

Between 1960 and 1970 the total number of housing units increased by 226,951 from 1,503,148 units in 1960 to 1,730,099 in 1970 (Table 13). This represents a 15.1 percent increase which is larger than the 11.4 percent increase in population, and implies that the number of people per household declined between 1960 and 1970 (Figure 18).

Of the 226,951 increase in housing units, more than 80,000 or 35.2 percent were located in just three counties--Marion, Allen, and Lake. The largest percentage increases in the number of housing units were in Brown (50.1 percent), Monroe (48.3 percent), Porter (39.0 percent), and Johnson (38.0 percent) counties. Four counties--Switzerland, Vermillion, Sullivan and Clay--experienced some decline in the number of housing units between 1960 and 1970.

Among the 14 Indiana planning regions, Regions 8, 10 and 11 experienced comparatively large growth rates in number of housing units. On the other hand, Regions 7, 9, 12 and 13 had relatively small increases.

Almost 98 percent of Indiana's residents were members of households in 1970 (Table 12). Persons not in households were living in institutional or group living quarters. Only three counties--Monroe, Putnam, and Tippecanoe--had less than 90 percent of their residents living in households. The average number of persons per household ranged from 2.81 in Green County to 3.57 in Lagrange County.

Number of persons per room and number of units lacking some plumbing facilities are often used as indicators of inadequate housing. In 1970, 6.5 percent of all year-round housing units, or 110,681 units lacked some plumbing facilities (Table 14) and 8.0 percent of all occupied units or 129,318 units had

1.01 or more persons per room (Table 15). In 1960 the respective percentages for Indiana were 17.3 and 11.4.

Type of Housing Structure

Of the 1,711,868 year-round housing units in Indiana, 1,341,101 were one-unit structures, 310,167 were two- or more-unit structures, and 60,630 were mobile homes or trailers (Table 14). On a percentage basis the year-round housing was 78.4 percent one-unit structures, 18.1 percent two- or more unit structures, and 3.5 percent mobile homes or trailers.

However, these figures vary considerably among the counties. Housing in Benton and Pulaski counties is about 93 percent one-unit structures. On the other hand less than 70 percent of the year-round housing in Monroe, Tippecanoe, Marion and Lake counties is one-unit structures. These counties contain relatively large numbers of two- or more unit housing structures.

Twenty-eight percent of Indiana's 60,630 mobile homes or trailers classified as year-round housing were located in seven counties--Marion, Allen, Lake, Monroe, Tippecanoe, Clark, and Elkhart. However, on a percentage basis, mobile homes and trailers represented only 1.6 percent of the year-round housing units in Marion and Lake counties. St. Joseph and Vanderburgh counties contained the smallest percentages of mobile homes, 0.85 and 1.17 percent respectively. The largest percentage of mobile homes was 8.9 percent in Martin County.

Median Housing Value and Rent

The median value of owner occupied housing units in Indiana was set at \$13,800 in 1970 (Figure 19 and Table 15). Three counties had median values in excess of \$17,000 per unit--Porter (\$18,000), Tippe-

canoe (\$17,300), and Hendricks (\$17,200). At the other extreme, Vermillion and Crawford counties reported median values of \$6,300 and \$6,800 respectively.

Three counties had median contract rents in 1970 which exceeded \$100 per month--

Monroe (\$114), Porter (\$110), and Tippecanoe (\$105) (Figure 20 and Table 15). On the other hand, three counties reported median contract rents below \$50 per month--Crawford (\$32), Spencer (\$47), and Pike (\$47). The state median contract rent paid in 1970 was \$82 per month.

Census Data Collection Procedures

Since its inauguration in 1790, the decennial census has attempted to count every person and household in the United States. Additional data are collected to enable the measurement of certain socio-economic characteristics of population and housing.

The 1970 census was conducted primarily through self-enumeration. In 1960, self-enumeration was first introduced on a nationwide scale as a substitute for the traditional census direct interview.

A census questionnaire was sent by mail to every household several days before April 1, 1970. This questionnaire contained certain explanatory information and was accompanied by an instruction sheet.

In larger metropolitan areas and some adjacent counties, altogether containing about three-fifths of the population of the United States, the householder was requested to fill out and mail back the form on April 1, 1970. Approximately 87 percent of the householders did so. The mailed back forms were reviewed by the census enumerator (or, in some localities, by a census clerk) and if the form was determined to be incomplete or inconsistent, a follow-up was made. The

bulk of these follow-ups were made by telephone, the rest by personal visit. For the households which did not mail back their forms, a follow-up was also made, in almost all cases by personal visit and in the remainder by telephone.

For the remaining two-fifths of the population, the householder was requested to fill out the form and give it to the enumerator when he called; approximately 80 percent did so. Incomplete and unfilled forms were completed by interview during the enumerator's visit.

Three types of questionnaires were used throughout the country: 80 percent of the households answered a form containing a limited number of population and housing questions and the remainder, split into 15 percent and 5 percent samples, answered forms which contained these questions as well as a number of additional questions. Some of the additional questions were the same on the 15 percent and 5 percent versions; others were different. A random procedure was used to determine which of the three forms any particular household answered. The items described in this report were covered on the 100 percent basis.

Selected Definitions

Male/Female Ratio X 100 -- The numerical ratio of male to female population in 1970 times 100.

Migration Rate, 1960-1970 -- The percentage calculation found by dividing net migration data by the population count at the beginning of the period involved (1960).

Natural Increase, 1960-1970 -- The numerical difference between births and deaths from 1960 to 1970; a negative (-) natural increase indicates that deaths exceeded births.

Net Migration, 1960-1970 -- The algebraic difference between natural increase and the difference between 1960 and 1970 number of inhabitants; a negative (-) net mi-

gration indicates a net out-migration and a positive (+) indicates a net in-migration.

Population Density -- The number of people per square land mile in 1970.

Rural Population -- All persons not classified as urban.

Urban Population -- All persons living in urbanized areas and in places of 2,500 inhabitants or more outside of urbanized areas.

Urban/Rural Ratio -- The numerical ratio of urban or rural population in 1970.

Year-Round Housing -- All occupied housing units plus vacant units intended for year-round use.
